PRODUCT, RESEARCH & OPERATIONAL PILOT

Bellevue Live! Pass

Two destinations. One connected visitor experience.

Research and implementation report | October 13, 2026

A working concept for tickets, trips, rewards, and rail-connected visits.

Selected supplied imagery illustrates proposed facilities. Events, transactions, AI responses, availability, and live media are demonstrations. This report does not establish commercial feasibility, approvals, cultural authority, or partner participation.

Executive overview

This project investigates whether a visitor platform connecting a proposed Bellevue arena district and a distinct proposed Tulalip entertainment destination can reduce planning effort and support measurable cross-destination visits. The artifact combines event discovery, ticket purchasing, accommodation, dining, mobility, group planning and tangible rewards. It uses three visual concepts and a working demonstration to expose the tradeoffs among event emphasis, destination discovery and contextual assistance. A targeted review of primary product descriptions, usability research, tourism theory, accessibility standards and Indigenous data governance informs the design. The proposed contribution is a testable service system that links transactions with practical travel and visitor control. Commercial outputs are illustrative scenarios, not forecasts. No partnership, franchise, development approval, transport agreement, media right, user-test result or economic impact is claimed. A staged mixed-method research protocol is supplied for subsequent evaluation.

Research question

How can an accessible, visitor-controlled digital platform connect two culturally and operationally distinct destinations to reduce trip-planning friction and increase completed cross-destination visits without obscuring cost, supplier responsibility or Indigenous authority?

Delivered prototype and limits

React and TypeScript provide a responsive browser-local visitor platform. Functional paths cover ticket-only checkout, package comparison, itinerary proposals, simulated multi-item booking, group voting, supplier conditions, refunds, reward progress, transportation guidance, local reminder preferences, and visit services. The manifest and service worker support installation and offline saved plans on compatible local/HTTPS origins. Private-host authentication may limit offline access.

The AI planner is deterministic and labeled as a simulation. It uses the sample October 23-24 weekend and compares two package structures. Invitations do not send messages. Live replay controls operate a labeled static-image demonstration. Commercial bookings, licensed video, synchronized accounts, supplier confirmations, and payment processing require the pilot integrations.

Visual direction

Premium Entertainment is the current visitor-facing direction following the requested blue, gold, cinematic refresh. The other two complete visual themes remain accessible in Compare designs. This choice is a product preference informed by expert assessment, not a measured conversion result.

1. Problem, scope and contribution

The supplied proposal positions Bellevue as an urban event anchor and Tulalip as a complementary destination with longer-stay family, sport and cultural possibilities. These are planning propositions. The application therefore distinguishes existing regional infrastructure from fictional event inventory and proposed facilities. It uses selected supplied renderings as concept imagery, while retaining the original confidential planning documents outside the deployed platform.

The visitor problem is fragmentation: a ticket may be simple to buy while the surrounding visit requires separate searches, incompatible times, duplicated party information and uncertain transport. The project responds with a shared itinerary and optional assisted planning. A local fan can still complete a ticket-only purchase. Cross-destination recommendations should earn attention through relevance, availability and total trip practicality.

The proposed innovation is the connection between booking, mobility and explicit rewards across independently governed destinations. Its success must be assessed by completed visits, useful time saved, satisfaction and locally retained value. Page views, AI conversations and gross booking volume are incomplete proxies. The demonstration establishes interaction feasibility; it cannot establish demand, investment feasibility or partner commitment.

2. Conceptual framework

Smart tourism describes coordination among information, physical infrastructure, businesses and visitor experience, rather than the presence of an app alone (Gretzel et al., 2015). Here that distinction implies that accurate service data and partner operations matter as much as visual design. The interface cannot remedy a nonexistent shuttle, unavailable room or unapproved cultural event.

Service-dominant logic directs attention to relationships and co-created value (Vargo & Lusch, 2004). For this project, visitors contribute preferences and decisions; operators contribute inventory, fulfillment and recovery. Customer-journey research adds a temporal view across discovery, purchase, use and subsequent engagement (Lemon & Verhoef, 2016). The resulting design retains support and cancellation visibility after checkout.

The experience-economy lens foregrounds visits (Pine & Gilmore, 1998). Destination competitiveness also calls for indicators beyond transaction counts (Dwyer & Kim, 2003). Accordingly, the research framework includes visitor satisfaction, local supplier participation and community-defined benefits. These are proposed measures, not demonstrated impacts.

Goal-gradient research gives a rationale for testing clear progress toward a reward (Kivetz et al., 2006). It does not establish that an arena ticket reward will increase profitable attendance. The design uses only actual qualifying purchases or visits, displays expiry and eligibility, and avoids artificial progress or concealed point equivalents.

The project model is: usable information and transparent costs support confidence; confidence and coherent planning reduce friction; practical transport and relevant rewards may support a second-destination visit; a well-delivered experience may support return behavior. Access requirements, available time, party composition, cultural relevance and transport conditions may moderate every link. All causal relationships remain hypotheses.

Evidence register: E13, E14, E15, E16, E17, E21. Full source references and limitations follow.

3. Competitive evidence and implications

Disney's official description brings tickets, plans, dining and navigation into one visitor experience; Universal describes travel-party management alongside ordering, maps and assistance (Walt Disney World Resort, n.d.; Universal Orlando Resort, n.d.). These establish useful capability precedents. They do not demonstrate that copying either interface would work for two separately governed Washington destinations.

Ticketmaster's published approach supports examining price transparency from the first selection stage (Ticketmaster, 2025). The Bellevue prototype therefore exposes mandatory charges and an explicit final total, while estimated meals and external transport remain separately labeled. Shortcuts into purchasing must not conceal conditions.

Chase Center illustrates adjacency between arena ticket services and mobile food ordering (Chase Center, n.d.). MGM shows how hotel arrival and dining can sit alongside entertainment (MGM Resorts International, n.d.). Live Nation's developer listing includes offline ticket access (Live Nation Worldwide, Inc., 2026). This project adopts the service relationships, not their proprietary technology or rights.

Public app descriptions were reviewed as evidence of advertised functionality. No proprietary app heatmaps, verified competitor conversion funnels or representative retention datasets were available in this review. Published screenshots and product claims do not justify precise uplift predictions. The report consequently uses explicit design hypotheses and a future testing protocol.

Evidence register: E01, E02, E03, E04, E05, E22. Full source references and limitations follow.

4. Information architecture and three design directions

The five persistent destinations are Explore, My Plans, Live, Rewards and Navigate. Explore opens event discovery; My Plans contains tickets and itinerary; Live contains the active-visit experience; Rewards explains available benefits; Navigate handles movement. Named labels accompany icons. Account settings remain in the top-right menu, while VIP and Plan with AI receive visible entry points in the primary content.

Material guidance supports a small set of bottom-navigation destinations; it does not prove these labels are optimal (Google, n.d.). Research on hidden navigation motivates exposing the main tasks, with the qualification that its mobile comparison was between hidden and combined navigation rather than all possible tab designs (Pernice & Budiu, 2016).

A Book-tab alternative could benefit purchase intent but competes with Explore, where specific inventory must first be selected. Live can be weak before a visit, yet gives direct access to ticket-adjacent venue actions. The current default retains Live and includes an informative empty state outside an event. A prospective tree test and first-click test will compare it with Book before any claim of superiority.

Concept A uses cinematic event imagery, navy and gold, and prominent ticket actions. Concept B uses lighter, spacious destination framing and emphasizes itinerary relationships. Concept C uses a restrained contextual dashboard for current plans and relevant benefits. Each must represent the same inventory and tasks so that later evaluation does not confuse styling with missing functionality.

Baymard's research suggests evaluating form burden rather than optimizing only for the count of checkout screens (Scott, 2024). Accordingly, ticket-only checkout asks for the minimum demonstration details, preserves selected quantity and lets visitors decline all additional services. Itinerary checkout groups items by supplier and exposes separate policies.

Evidence register: E10, E11, E12. Full source references and limitations follow.

5. End-to-end service design

Discovery supports destination, category, date, price and party filters. Cards indicate that inventory is fictional, identify the destination, and show an intelligible price basis. A selected event leads to details, ticket quantity, accessible options and the reviewable purchase total. Sold-out items lead to an opt-in availability alert instead of a dead end.

The itinerary combines proposed activities and confirmed demonstration bookings. Each item retains its date, Pacific Time, location, party count, supplier terms and status. Conflict checks identify overlapping events and missing travel time. A separate return journey is required for a complete transport plan. Removing one activity should not silently cancel dependent reservations.

Collaborative planning uses sample participants to demonstrate invitations, votes and individual booking status. A group organizer sees pending decisions without implying that everyone has paid. Votes select preferred activities, not purchases. A participant may choose a different activity or refrain from booking without losing access to shared trip information.

The assisted planner translates a natural-language request into structured preferences and alternatives. Missing dates, party composition, budget or access needs trigger targeted follow-up controls. Package comparisons explain what is included, which costs are estimates and which tradeoffs produced the recommendation. The user can remove or replace each suggestion. No purchase or cancellation occurs on the strength of a chat message alone.

Best value means a feasible combination within stated priorities; it is not necessarily the lowest advertised ticket price. Total party costs include mandatory charges and selected transport, while taxes and estimates must be plainly identified. The system cannot call a package optimal across the market when it searches only demonstration inventory.

The visit companion surfaces the next action: a ticket, meeting point, restaurant reservation or departure. A simulated disruption offers an editable alternative and makes timing uncertainty visible. Alerts are opt-in by category and may be reset. Privacy controls and help remain accessible at every stage.

6. Mobility and the light-rail proposition

BelRed is an existing 2 Line station and its official page lists accessible platforms (Sound Transit, n.d.-a). The Crosslake Connection opened in March 2026 (Sound Transit, 2026). These verified facts support a rail-first Bellevue concept. They do not verify a future arena's entrance, pedestrian bridge, walking duration or operating arrangements.

The fare page retrieved on 13 October 2026 lists adult Link rides at $3, youth travel through age 18 as free, and eligible reduced fares at $1. ORCA or contactless transfers receive credit within two hours; Link does not require tap-off (Sound Transit, n.d.-b). The demonstration treats these as dated reference facts, with a link to current agency information.

Exact itineraries and departure times are illustrative. The station page at retrieval also carried a scheduled October 17-18 crosslake disruption; this reinforces the need to consult current alerts. A production journey engine must combine route data, disruptions, user-selected walking constraints and transfer buffers. Static diagrams cannot guarantee step-free availability.

Tulalip is represented as a separate onward road connection, with shuttle, accessible vehicle or rideshare options subject to real operators and agreements. An optional event-plus-transit offer would need defined validity, redemption, reimbursement and responsibilities. A demonstration pass is never presented as an official ORCA fare medium.

Mobility evaluation should measure completed trips and missed connections as well as booking uptake. Proposed indicators include transport choice, return-trip completeness, reported confidence, help requests and missed departures. Any sustainability claim would require an explicit emissions method and travel-substitution evidence; the prototype makes no such quantified claim.

Evidence register: E06, E07, E08. Full source references and limitations follow.

7. Promotions, real rewards and commercial controls

The demonstration distinguishes qualifying ticket purchases from attendance at distinct events. A three-ticket offer may unlock one eligible cross-destination admission; a separate repeat-visit offer may unlock another tangible benefit. Ticket quantity and visit count must never share an ambiguous progress label. Promotions are hypothetical, and each has its own qualification rule, inventory, validity and refund treatment.

The proposed operational ledger records the triggering booking or attendance confirmation and the benefit consumed. Canceled or refunded purchases reverse unredeemed qualification. If a reward has already been used, the provider applies the clearly agreed policy and a support path; the platform should not silently create debt. Promotion stacking is disabled unless explicitly permitted by both suppliers.

Complimentary inventory is a cost even when supplied from unused capacity. Reimbursement, capacity displacement, administration and potential incremental spend should be modeled separately. Benefits can be funded by supplier contributions, contracted promotion budgets, sponsorship or platform margin. Gross booking value must not be confused with platform revenue.

The illustrative $10,000 VIP threshold is a scenario rather than a recommendation. Qualifying spend needs an explicit basis, exclusions, period and reset policy. Benefits should be limited to authorized hospitality, priority services or inventory-backed experiences. An expensive threshold may be inappropriate for families and budget visitors, so ordinary rewards remain useful independently.

The accompanying unit-economics scenarios should compare contribution before and after rewards, weaker redemption economics, higher support costs and supplier concentration. A positive illustrative margin is not an investment case. Real launch decisions require contracted economics, demand evidence, cancellations, taxes and the costs of providing reliable service.

8. Tribal authority, cultural representation and data governance

The Tulalip Tribes' own account establishes its community and sovereignty; it does not endorse this proposal (The Tulalip Tribes, n.d.). Participation should be negotiated with the authorities and entities they identify. Cultural representation, business contracting and research approval may involve different responsibilities, and none is inferred from a supplied concept image.

CARE frames data governance through collective benefit, authority to control, responsibility and ethics (Carroll et al., 2020). Applied here as a project proposal, this means the relevant tribal partner determines permitted cultural material, publication conditions, collective-data uses and review or withdrawal processes. Individual app consent cannot substitute for that authority.

Each cultural listing should have an identified authorized publisher, provenance, usage permissions and approval status. The prototype must not invent ceremonies, restricted knowledge, permission to photograph or generalized Indigenous authenticity. Intertribal events require the agreement of participating nations, with names, protocols and benefit arrangements represented distinctly.

Proposed commercial agreements should specify listing visibility, commission, reward reimbursement, settlement timing, cancellations and dispute resolution. Community benefit can be evaluated through measures selected by the partner, such as participating businesses, paid local work or retained revenue. No universal community-benefit metric should be imposed as a condition of joining.

A production data agreement should distinguish personal booking data, supplier operations, cultural intellectual property and collective or aggregate visitor data. Restrict access by purpose, minimize retention, and permit audit and agreed deletion. Do not infer tribal affiliation from names, browsing or location, and do not expose an individual's access requirements to group participants by default.

Evidence register: E18, E19. Full source references and limitations follow.

9. Accessibility, privacy and trust

WCAG 2.2 AA is the evaluation target, not a certification claim (World Wide Web Consortium, 2024). Checks cover keyboard paths, visible focus, semantic controls, contrast, reflow, target sizes, error messages, reduced motion and complete checkout flows. Persistent navigation and modal dialogs require particular attention to focus order and obstruction.

Access preferences must be specific: step-free access, companion seating, mobility-device space, captions, sensory considerations or dietary needs are different requirements. A single accessible badge cannot guarantee all of them. Availability should remain subject to supplier verification, with a contact route for requirements the system cannot confirm.

The demonstration stores sample state locally and provides reset. Operational accounts would require authentication, access control, deletion and retention policies. Payment data should be handled through an appropriate provider rather than stored in application state. AI prompts must avoid exposing payment credentials or unnecessary health details.

Trust relies on clear transaction state: proposed, held, purchased, canceled and refunded are different. An offline itinerary may be useful while inventory and transactions are unavailable. The screen should show stale or disconnected status and prevent duplicate commitments when connectivity returns.

Evidence register: E09. Full source references and limitations follow.

10. Live media and service feasibility

Published League Pass restrictions demonstrate that viewing rights depend on context and territory (NBA Help Center, n.d.). They do not confer distribution rights on this project. Live games, multi-camera replay, highlights, statistics and captions require separate technical and rights assessments.

The prototype should use synthetic replay controls and sample statistics. Its key question is whether visitors can find and operate the experience, not whether a league feed has been secured. Venue maps, food and merchandise ordering also depend on supplier systems, fulfillment rules and operational staffing.

An operational pilot should specify entitlement checks, geofencing where required, media accessibility, latency, content protection and fallbacks. A rights failure must leave tickets, venue help and travel usable. Customer support cannot assume responsibility ends at the edge of an embedded supplier service.

Evidence register: E20. Full source references and limitations follow.

11. Proposed empirical methodology

This is a design-science artifact and a research protocol, not an empirical results paper. The initial desk review is targeted and transparent rather than exhaustive or systematic. The next phase begins with partner discovery and university ethics review where appropriate, followed by visitor interviews, formative usability sessions and a controlled comparative study.

Recruit across the eight journey types while allowing participants to have overlapping needs. Indigenous participation and interpretation should be arranged with relevant partners, with fair compensation and agreed handling of findings. Include disabled participants using their own assistive technologies and device settings. Do not use persona names as substitutes for representative recruitment.

For formative work, propose 24 participants completing selected tasks across the three concepts in counterbalanced order. This number is a design choice for qualitative breadth, not a power calculation. Record task completion, major errors, assistance, time and an after-task ease response. Follow with interviews about cost comprehension, reward rules and trust. Analyze recurring problems and disconfirming cases.

A navigation study compares the original tabs with the Book alternative using the same labels, tasks and content. First-click tasks include finding a ticket, reserving a hotel, getting to the venue, and viewing a replay. Preregister primary outcomes and exclusion rules. Conduct a power analysis after collecting baseline variance; do not claim a statistically reliable advantage from a small convenience sample.

A later operational field pilot can randomize eligible parties to ordinary discovery versus optional integrated planning or a transparent reward offer. Use assignment-to-treatment analysis and account for shared-party decisions. Predefine attendance windows and independently verify authorized redemption records. Avoid presenting self-reported intent as completed cross-destination travel.

Collect behavioral telemetry only with appropriate consent and agreements. A suggested event dictionary includes event_view, ticket_selection, checkout_review, purchase_confirmed, plan_item_added, route_selected, reward_unlocked, reward_redeemed and help_requested. Never include payment credentials or unrestricted prompt text in analytics. Report missing data, withdrawals, device effects and uncertainty.

Heatmaps or click maps may be generated from a later consented study, with form and personal-data masking. They would describe tested participants and tasks, not all users. Gaze measurement would require suitable hardware, calibration and an explicit protocol. No synthetic heatmap should be labeled as measured attention.

12. Limitations and next research contribution

The prototype contains fictional inventory and simulated transactions. Browser-local collaboration does not demonstrate multi-user synchronization, reconciliation or provider availability. A static deployment does not establish payment security, operational resilience, live media delivery or enterprise access governance.

The current source set combines foundational theory, published usability research and official feature descriptions. It is not a comprehensive review of every destination app and contains no proprietary competitor analytics. Product capabilities and transit conditions may change after the retrieval date.

Expert design scores can make tradeoffs explicit but cannot predict conversion. Their weights represent project priorities and should be revisited with stakeholders. University publication would require an appropriate venue, a fuller literature-search method, ethics approval where needed and transparent empirical evaluation.

The defensible contribution at this stage is a concrete, testable design linking visitor control, truthful rewards and complete mobility across distinct destinations. Further work should investigate when this integration produces additional attendance and shared economic benefit, and when travel constraints or visitor preferences make a single-destination visit the better outcome.

Expert comparison of the three designs

Scores below are heuristic judgments of the rendered prototype, on a 1-5 scale. They are not usability measurements. The weighted percentage is sum(weight x score / 5). All concepts share the working booking logic; the distinction is presentation and first-action emphasis.

Criterion	Weight	A	B	C
Usability and booking efficiency	25%	4.5	4.5	4
Discovery and cross-destination potential	20%	4	4.5	4.5
Accessibility	15%	4	4.5	4
Visual hierarchy and cognitive load	15%	4.5	4.5	4
Rewards and VIP discoverability	10%	4.5	4	4
Commercial and technical feasibility	10%	4	4	4
Research defensibility	5%	4	4.5	4
Weighted expert score	100%	85.0/100	88.0/100	82.0/100

Screen evidence and tradeoffs

A puts the featured arena event and two primary actions on a cinematic first screen; deep navy and gold reinforce the supplied brand imagery. The search dock, image-led stays and dining, and clear VIP control carry the same style. Practical event filters sit lower on small screens. B makes search and destination relationships lighter and calmer, with lower visual competition. C adds a contextual card for the current visitor; this is useful after a saved plan exists but less distinctive for a first visit.

Sensitivity and decision

Moving 10 weight points from discovery to hierarchy yields A 86.0, B 88.0, C 81.0. Moving 10 points from usability to discovery yields A 84.0, B 88.0, C 83.0. B remains the narrow expert-rubric leader; the chosen A direction honors the requested visual character while retaining B’s practical booking structure. Actual task evidence could reverse this assessment.

Navigation comparison

Retained: Explore, My Plans, Live, Rewards, Navigate. Alternative: Explore, My Plans, Book, Rewards, Navigate. Book could expose hotels sooner but duplicates contextual purchase actions and removes immediate replay/seat-service access. The current demo provides booking shortcuts and the account menu instead. No first-click study has yet established a winner.

Eight persona journeys

These are design personas drawn from the project brief, not interviewed participants. Each is an explicit scenario for future evaluation.

P1 | Local basketball fan

Attend a Bellevue game with minimal planning effort.

Needs: Two seats together, a clear all-in total, rail arrival and a viable return.

Journey: Filter Bellevue sports by date and price. / Select two fictional tickets and review charges. / Choose optional rail guidance; decline hotel and meal additions. / Confirm the demo purchase and save the tickets. / Use Navigate for the station leg and My Plans for the return. / View qualifying-ticket progress and an optional Tulalip offer.

Friction: Unexpected fees, forced packages or confusing ticket versus transit credentials.

Accessibility: One-handed use, readable tickets in low light, clear labels and offline saved plans.

Cross-destination value: A later qualifying event, offered after the primary purchase.

Evaluation: Keep the primary ticket action available; measure ticket-only completion, price comprehension and support requests.

P2 | Family visiting the proposed water park

A manageable day for adults and children.

Needs: Age suitability, group price, changing facilities, meal options and rest breaks.

Journey: Filter Tulalip family activities by chosen date. / Enter adults and children separately. / Inspect fictional capacity, access information and restrictions. / Compare a day visit with an optional overnight stay. / Add transport and meal times without compressing rest periods. / Purchase selected items and share the sample plan. / Review a Bellevue family event only if the schedule is comfortable.

Friction: Per-person prices hiding family cost, unclear age bands or incompatible room occupancy.

Accessibility: Stroller and mobility-device information, plain language, flexible pacing and dietary details.

Cross-destination value: Optional separate-day Bellevue visit rather than a pressured same-day transfer.

Evaluation: Show party total and restrictions before checkout; measure errors in party composition and condition recall.

P3 | Tourist combining both destinations

Build a coherent weekend without managing many disconnected bookings.

Needs: Dates, room nights, total budget, reliable transfers and attraction timing.

Journey: Describe a two-day trip to the planner. / Supply party size, budget and arrival location. / Compare feasible packages and remove an unwanted suggestion. / Add hotel, dinner, Bellevue event and a later Tulalip activity. / Review separate suppliers and estimated external costs. / Confirm the demo basket and inspect itinerary conflicts. / Use the visit companion for each next step.

Friction: Mixed policies, a hotel far from the next activity or understated transport cost.

Accessibility: Clear Pacific Time, familiar currency labels, readable directions and human help.

Cross-destination value: Central to the journey, conditional on realistic road travel.

Evaluation: Measure complete-plan rate, conflicts detected, omitted costs and trust calibration.

P4 | Indigenous visitor attending an intertribal event

Attend an appropriately represented event and connect with participants.

Needs: Authorized host information, attendance rules, schedule and family/group logistics.

Journey: Find the clearly labeled illustrative intertribal listing. / Inspect host approval status and participation information. / Choose only publicly offered activities. / Coordinate a group plan and transport. / Access event guidance and support. / Consider unrelated Bellevue entertainment only if desired.

Friction: Generic cultural descriptions, uncertain host authority or treating every activity as a purchasable attraction.

Accessibility: Language and elder-access needs must be asked about, not presumed; low-bandwidth alternatives.

Cross-destination value: Voluntary and secondary to the purpose of the visit.

Evaluation: Partner review of content and consent; assess participant-reported representation and clarity using agreed methods.

P5 | VIP customer

A reliable premium experience for guests.

Needs: Specific inclusions, seating, hospitality timing, room type and concierge support.

Journey: Open the prominent VIP entry. / Compare itemized premium options. / Select guests, room and dining preferences. / Review accessible seating and transport details. / Confirm the chosen demo package. / Use My Plans for guest booking status and concierge contact. / Inspect transparent qualifying spend and benefits.

Friction: Vague exclusivity claims or uncertainty over what is included.

Accessibility: Same inclusive requirements as all visitors; premium purchase does not replace access provision.

Cross-destination value: Optional premium dining or second event if travel timing works.

Evaluation: Measure inclusion comprehension, service issue resolution and margin after fulfillment.

P6 | Visitor with accessibility requirements

Participate confidently with appropriate access and autonomy.

Needs: Verified, specific information about the entire journey.

Journey: Set relevant access preferences without a diagnosis. / Inspect seating and companion options. / Compare a step-free route and an accessible vehicle alternative. / Identify uncertain venue or route details and contact support. / Save the plan with additional transfer time. / Use accessible tickets, captions and venue guidance. / Report a barrier and request an alternative.

Friction: Generic accessible badges, inaccessible seat maps or forced telephone-only booking.

Accessibility: Individual requirements vary; test with actual users and assistive technologies.

Cross-destination value: Only if both destination and transport requirements can be met.

Evaluation: Measure independent completion and unresolved barriers; supplier verification must precede real guarantees.

P7 | Business traveler with limited time

Fit an event or meal around work commitments.

Needs: End times, proximity, cancellation terms and a hard arrival/departure limit.

Journey: Enter the available time window. / Select nearby Bellevue options. / Compare ticket-only with a short dinner package. / Reject suggestions that conflict with a meeting. / Confirm a demo booking and export or copy itinerary information where supported. / Receive the next departure reminder.

Friction: Long recommendations, repeated personal details or uncertain end times.

Accessibility: Efficient keyboard use, concise information, quiet notifications.

Cross-destination value: A future visit or a free day, not an assumed same-evening journey.

Evaluation: Measure time to find a feasible option and number of irrelevant suggestions rejected.

P8 | Budget-conscious visitor

Enjoy events within an explicit whole-trip spending limit.

Needs: Total cost, eligible offers, transport cost and clear reward terms.

Journey: Choose a budget and flexible dates. / Compare discounted event options and rail travel. / Inspect exclusions and validity before selecting a promotion. / Buy only needed tickets. / Review purchase and attendance trackers separately. / Redeem an eligible benefit against available inventory. / See how cancellation changes progress.

Friction: Savings anchored to unavailable prices, points conversions or rewards with costly hidden conditions.

Accessibility: Plain-language conditions, low-data pages and inclusive reduced-fare information.

Cross-destination value: Only when incremental travel and food costs remain affordable.

Evaluation: Measure total-cost accuracy, eligibility comprehension, redemption failures and net cost to the visitor.

Commercial model and controls

The editable commercial-model.xlsx contains Economics, Rewards, and Sensitivity sheets. All numerical inputs are declared assumptions in USD. Blue figures on amber cells are inputs; formulas calculate the outcomes. The model is illustrative, with no supplier contract or demand forecast.

Measure	Illustrative base case
Gross booking value / order	$420.00
Retained revenue at 8%	$33.60
Processing (2.5% + $0.30)	$10.80
Variable support	$3.50
Refund reserve (1%)	$4.20
Expected reward reimbursement	$1.80
Variable contribution / order	$13.30
Monthly contribution, 1,000 orders and $12,000 fixed cost	$1,300.00

Funding and sensitivity

Reward cost is earned probability x redemption probability x supplier reimbursement, offset only by an agreed partner contribution. The base calculation is 20% x 50% x $18 = $1.80 per order. Raising redemption to 100% reduces contribution from $13.30 to $11.50. Reimbursement is a supplier payment assumption, not retail face value. The sensitivity grid varies revenue share and redemption probability. No breakage or cross-sell uplift is presumed.

Operational safeguards

Reserve eligible admission inventory before redemption; exclude expired and exhausted offers; never stack promotions unless terms allow it; reconcile supplier settlement and refunds; record liability separately from marketing value. The prototype shares sample inventory between paid and complimentary admission. A cancellation reverses qualifying activity and flags a dependent reward for review. A future policy must decide whether an already-used reward leads to recovery, fee adjustment, or no recovery, with clear consent and support.

VIP economics

The spending-based example uses a $10,000 qualifying-spend threshold and a capped $250 benefit. Expected contribution must cover the redeemed benefit and incremental service cost; it must not be inferred from gross spend. The workbook contains editable conversion, redemption, and reimbursement assumptions. This is an illustrative offer, not a contractual loyalty benefit.

Accessibility and validation record

Assessment scope: WCAG 2.2 AA criteria relevant to the prototype. Implementation includes native buttons and labels, visible focus, a skip link, modal dialog semantics, reduced-motion rules, text alternatives, form validation, and sample accessibility requests. No WCAG conformance certification or assistive-technology user study is claimed.

Area	Evidence / limitation
Responsive layout	Mobile 390px, tablet 768px and desktop 1440px rendered; three themes and eight mobile screen groups captured.
Keyboard and focus	Native dialogs contain focus; Escape closes. Visible focus and keyboard activation checked in Chromium. Manual screen-reader evaluation remains required.
Contrast	Navy/gold text hierarchy and solid overlay panels used. Primary palettes checked by contrast calculation; complex photographic areas still require human review.
Motion	Reduced-motion media query disables animation and transitions. No autoplay video or flashing effects.
Errors and prices	Itemized totals precede explicit purchase confirmation; sold-out offers show alert flow; invalid dates and quantities have feedback.
Connectivity	Service worker pre-caches app shell and local imagery; saved plans remain browser-local. Hosted authentication can limit offline navigation.
User research	No recruited participants, heatmaps, eye tracking or conversion experiment. All journey expectations are hypotheses.

Executed browser checks

Ticket-only: 3 tickets, $285, confirmation and persistence; Earned reward redeemed without payment; Group participant and activity vote persisted independently; Refund cancels ticket and recalculates reward qualification; AI simulation creates 6 itemized proposed components for 4, including separate coach; Coordinated hotel, dinner, game, water park, rail and coach checkout; Transportation disruption alternative visible; Unavailable inventory offers an opt-in local alert; Keyboard focus reaches controls; 24 mobile screen captures plus 6 tablet/desktop captures.

Domain and financial verification

Automated domain cases cover fee totals, premium seating with access requests, inventory restoration, quantity validation, family promotion exclusions, reward expiry and eligibility, nonstacking, reward inventory, package arithmetic, and timing warnings. Workbook formulas were recalculated, error-scanned and stressed at 100% redemption. These checks verify sample logic, not provider reliability.

Operational-pilot roadmap

0 - Concept demonstration

Three designs, browser-local working journeys, evidence register, illustrative commercial model and research protocol.

Exit criteria: Consistent state, transparent simulated content, complete critical paths and documented validation limits.

1 - Co-design and agreements

Visitor research; tribal and supplier participation terms; cultural review; inventory and transit data access; payment and support responsibilities.

Exit criteria: Authorized pilot scope, data governance, rights and approved content.

2 - Limited operational pilot

Authenticated accounts, provider sandbox-to-live booking, payment confirmation and refunds, availability reconciliation, alerts, accessible support.

Exit criteria: End-to-end supplier acceptance, monitoring, incident handling, refund tests and accessibility review.

3 - Measured expansion

Controlled offer evaluation, multi-user collaboration, validated recommendations and any separately licensed media.

Exit criteria: Evidence of visitor value, sustainable contribution, partner benefit and acceptable failure rates.

Provider boundaries and responsibility

Typed provider interfaces separate event inventory, availability, bookings, payments, promotions, rewards, transit, media and AI. Replace the adapters in a server-backed pilot. Require idempotency keys, inventory holds, payment authorization, webhook verification, a booking ledger, partial-failure recovery, supplier-specific refunds, secure account consent, and agreed data retention. AI may propose or explain; authoritative prices and purchase authorization stay in deterministic services.

Release gates

No operational launch until partner participation and cultural authority are documented, rights cleared, live data validated, accessibility independently reviewed, payment and booking providers reconciled, and support/refund escalation rehearsed. Limited destinations and inventory should precede rail-corridor expansion.

Evidence register and APA-style references

Retrieved October 13, 2026 unless a source entry states otherwise. Published capabilities do not prove a design outcome. Evidence types, limitations and design implications are preserved in evidence.json and in the app Research screen.

E01 | My Disney Experience mobile app

Walt Disney World Resort. (n.d.). My Disney Experience mobile app.

https://disneyworld.disney.go.com/guest-services/my-disney-experience/mobile-apps/

Finding: The official app brings plans, tickets, dining, navigation and personalized itinerary assistance together.

Limit: Feature marketing establishes advertised capability, not independently measured task success or conversion.

E02 | The official Universal Orlando app

Universal Orlando Resort. (n.d.). The official Universal Orlando app.

https://www.universalorlando.com/web/en/us/landing-page/mobile-app

Finding: Universal describes a ticket wallet, travel party, dining reservations, mobile ordering, maps and virtual assistance.

Limit: Availability is selective; feature descriptions do not prove usability, economic uplift or applicability to Bellevue.

E03 | Ticketmaster rolls out All In Prices as the global standard; outlines improvements to the ticketing experience

Ticketmaster. (2025, May 12). Ticketmaster rolls out All In Prices as the global standard; outlines improvements to the ticketing experience.

https://business.ticketmaster.com/press-release/all-in-prices/

Finding: Ticketmaster announced US upfront ticket prices including fees before taxes.

Limit: Corporate announcement; it is not a causal study and excludes taxes from its stated upfront price.

E04 | Season Ticket Family mobile ordering guide

Chase Center. (n.d.). Season Ticket Family mobile ordering guide.

https://www.chasecenter.com/food-and-beverage-guide/

Finding: The arena guide connects mobile food ordering with ticket management and event discovery.

Limit: Search-indexed official text was accessible; full dynamic page content was not. No measured efficiency claim is adopted.

E05 | MGM Rewards mobile app

MGM Resorts International. (n.d.). MGM Rewards mobile app.

https://www.mgmresorts.com/en/app.html

Finding: MGM describes mobile check-in, digital room keys at participating properties, dining reservations and show booking.

Limit: Capabilities depend on property and eligibility; these are product descriptions, not evidence of Bellevue integrations.

E06 | BelRed Station

Sound Transit. (n.d.-a). BelRed Station.

https://www.soundtransit.org/ride-with-us/stops-stations/belred-station

Finding: BelRed is served by the 2 Line; both listed platforms are marked accessible. The page carries current arrivals and service alerts.

Limit: Station accessibility does not verify a future venue walking route. Alerts are time-sensitive.

E07 | Fares

Sound Transit. (n.d.-b). Fares.

https://www.soundtransit.org/ride-with-us/how-to-pay/fares

Finding: Link 1/2 adult fares are $3 one way; youth 18 and under travel free; eligible reduced fares are $1. ORCA/contactless transfer credit applies within two hours.

Limit: Snapshot retrieved 13 October 2026; eligibility and fare products require agency validation. This platform has no fare-sale agreement.

E08 | Link light rail opens across Lake Washington

Sound Transit. (2026, March 28). Link light rail opens across Lake Washington.

https://www.soundtransit.org/get-to-know-us/news-events/news-releases/link-light-rail-opens-across-lake-washington

Finding: The Crosslake Connection opened on 28 March 2026, joining the 2 Line with the regional network.

Limit: Opening-day service descriptions are not a current timetable and do not establish a direct rail service to Tulalip.

E09 | Web Content Accessibility Guidelines (WCAG) 2.2

World Wide Web Consortium. (2024, December 12). Web Content Accessibility Guidelines (WCAG) 2.2.

https://www.w3.org/TR/WCAG22/

Finding: WCAG 2.2 specifies testable accessibility success criteria, including keyboard operation, contrast, focus and target-size requirements.

Limit: Meeting selected checks does not establish full conformance; evaluation must include content, complete processes and assistive technology.

E10 | Understanding navigation

Google. (n.d.). Understanding navigation. Material Design.

https://m2.material.io/design/navigation/

Finding: Material guidance places three to five top-level destinations in a mobile bottom navigation bar.

Limit: Guidance is not a study proving the optimal labels or order for this particular platform.

E11 | Hamburger menus and hidden navigation hurt UX metrics

Pernice, K., & Budiu, R. (2016, June 26). Hamburger menus and hidden navigation hurt UX metrics. Nielsen Norman Group.

https://www.nngroup.com/articles/hamburger-menus/

Finding: A study with 179 participants on six sites found hidden navigation less discoverable than visible or combined navigation.

Limit: The mobile study compared hidden with combined navigation, not every visible-navigation variant. Sites and devices differ from this prototype.

E12 | Checkout optimization: 5 ways to minimize form fields in checkout

Scott, E. (2024, June 26). Checkout optimization: 5 ways to minimize form fields in checkout. Baymard Institute.

https://baymard.com/research-articles/checkout-flow-average-form-fields

Finding: Baymard's checkout research emphasizes the burden of form fields over simply counting checkout steps.

Limit: General ecommerce evidence; the public article does not expose all raw data, and travel bookings require different information.

E13 | Smart tourism: foundations and developments

Gretzel, U., Sigala, M., Xiang, Z., & Koo, C. (2015). Smart tourism: Foundations and developments. Electronic Markets, 25, 179-188. https://doi.org/10.1007/s12525-015-0196-8

https://link.springer.com/article/10.1007/s12525-015-0196-8

Finding: Smart tourism connects destination infrastructure, information, businesses and visitor experience; an app alone is insufficient.

Limit: Conceptual position paper, not an experimental estimate of visitation effects.

E14 | Evolving to a new dominant logic for marketing

Vargo, S. L., & Lusch, R. F. (2004). Evolving to a new dominant logic for marketing. Journal of Marketing, 68(1), 1-17. https://doi.org/10.1509/jmkg.68.1.1.24036

https://courses.ischool.berkeley.edu/i210/f07/readings/VargoLusch.pdf

Finding: The paper frames exchange around service, relationships and the co-creation of value.

Limit: Broad marketing theory does not establish this platform's market fit or commercial viability.

E15 | Understanding customer experience throughout the customer journey

Lemon, K. N., & Verhoef, P. C. (2016). Understanding customer experience throughout the customer journey. Journal of Marketing, 80(6), 69-96. https://doi.org/10.1509/jm.15.0420

https://pure.rug.nl/ws/files/81733365/Understanding_Customer_Experience_Throughout_the_Customer_Journey.pdf

Finding: Customer experience extends across stages, channels and touchpoints involving multiple partners.

Limit: Integrative framework rather than a trial of a dual-destination product.

E16 | Welcome to the experience economy

Pine, B. J., II, & Gilmore, J. H. (1998). Welcome to the experience economy. Harvard Business Review, 76(4), 97-105.

https://hbr.org/1998/07/welcome-to-the-experience-economy

Finding: Memorable experiences form a distinct economic offering.

Limit: Conceptual framing, not causal evidence.

E17 | The goal-gradient hypothesis resurrected: Purchase acceleration, illusionary goal progress, and customer retention

Kivetz, R., Urminsky, O., & Zheng, Y. (2006). The goal-gradient hypothesis resurrected: Purchase acceleration, illusionary goal progress, and customer retention. Journal of Marketing Research, 43(1), 39-58.

https://s3.amazonaws.com/fieldexperiments-papers2/papers/00658.pdf

Finding: Field and experimental work links proximity to a reward goal with greater effort or purchase acceleration.

Limit: Consumer reward contexts differ from high-cost arena visits. Effect sizes cannot be transferred to this proposal.

E18 | The CARE Principles for Indigenous Data Governance

Carroll, S. R., Garba, I., Figueroa-Rodríguez, O. L., Holbrook, J., Lovett, R., Materechera, S., Parsons, M., Raseroka, K., Rodriguez-Lonebear, D., Rowe, R., Sara, R., Walker, J. D., Anderson, J., & Hudson, M. (2020). The CARE Principles for Indigenous Data Governance. Data Science Journal, 19, Article 43. https://doi.org/10.5334/dsj-2020-043

https://doi.org/10.5334/dsj-2020-043

Finding: CARE addresses Collective Benefit, Authority to Control, Responsibility and Ethics for Indigenous data.

Limit: A general framework cannot substitute for nation-specific authority, consultation or agreements.

E19 | Who we are

The Tulalip Tribes. (n.d.). Who we are.

https://www.tulaliptribes-nsn.gov/WhoWeAre

Finding: The Tulalip Tribes describes its community and tribal sovereignty.

Limit: The source establishes identity and context, not approval of the Bellevue Live proposal.

E20 | League Pass blackout guide

NBA Help Center. (n.d.). League Pass blackout guide.

https://support.watch.nba.com/hc/en-us/articles/115002481154-League-Pass-Blackout-Guide

Finding: League Pass viewing is subject to geographic and broadcast restrictions.

Limit: Consumer subscription rules do not grant a third-party arena app replay or distribution rights.

E21 | Destination competitiveness: Determinants and indicators

Dwyer, L., & Kim, C. (2003). Destination competitiveness: Determinants and indicators. Current Issues in Tourism, 6(5), 369-414. https://doi.org/10.1080/13683500308667962

https://khu.elsevierpure.com/en/publications/destination-competitiveness-determinants-and-indicators-2/

Finding: The model combines subjective and objective destination indicators and links competitiveness to socioeconomic prosperity.

Limit: Institutional abstract and bibliographic record reviewed; not a Bellevue-specific estimate.

E22 | Live Nation At The Concert

Live Nation Worldwide, Inc. (2026, September 24). Live Nation At The Concert [Mobile app]. Google Play.

https://play.google.com/store/apps/details?id=com.livenation.mobile.android.na

Finding: The developer lists ticket purchase, mobile entry, offline ticket viewing, ordering and ticket transfer at participating venues.

Limit: Developer claims describe capabilities; app-store reviews and ratings are not used as representative usability evidence.
